

SHRADDHA SINGH

Product Manager, Sapiens International · AI-First PM Workflow

shraddhasingh8968@gmail.com | +91-8149114461 | [LinkedIn](#)

I don't just manage AI products — I use AI in every layer of my PM work and build real products with it. This is a brief look at how AI shows up in my day-to-day and in the things I've shipped.

HOW I USE AI IN MY DAILY PM WORKFLOW

Product Manager at Sapiens International · Current Role

AI tools are embedded in how I work, not used occasionally.

WRITING & DOCUMENTATION

- Draft user stories and acceptance criteria with AI — I describe the feature intent and edge cases, then refine the output to match engineering vocabulary and sprint format
- Generate first drafts of PRDs, API documentation, and release notes; focus my time on decisions and review, not blank-page writing
- Use AI to summarise long stakeholder feedback threads and extract prioritisation signals

RESEARCH & DISCOVERY

- Run competitive analysis and market research with AI — synthesise multiple sources into structured insights for roadmap decisions
- Use AI to stress-test feature assumptions: "What would a power user do here? What breaks at scale?"

API DESIGN

- Use AI tools to draft API contracts, endpoint schemas, and error response structures — especially useful when working across backend teams at Sapiens
- Validate field naming conventions, HTTP semantics, and edge case handling before sharing specs with engineering

PRODUCTS I'VE BUILT WITH AI

JobSignals — Job Market Intelligence Tool

Status: Built | Stack: Python (FastAPI + PostgreSQL) + Anthropic Claude API

A tool that uses Claude to extract structured hiring signals — skill demand, seniority cues, salary proxies — from unstructured job posting text at scale.

- Claude API handles extraction from freeform JD text; PostgreSQL stores structured output for trend queries
- Built the full product: prompt design, API layer, database schema, and front-end dashboard
- **What it taught me as a PM:** Prompt design is acceptance criteria. The precision required to get consistent structured output from Claude is exactly the discipline needed to write good feature specs — define the schema, handle the edge cases, specify fallback behavior

StrategyOS — AI Strategic Intelligence Engine

Status: In Progress | Stack: HTML/CSS/JS + AI API integration

An AI-powered tool for founders, investors, and operators — generates fundraising readiness assessments, SWOT analyses, and scenario simulations from company inputs.

- Designed the multi-step input flow, scoring logic, and output structure
- Integrated AI to generate narrative strategy briefs from structured form data
- Handles multiple use cases in one product: fundraising readiness, competitive positioning, scenario planning

WHAT THIS MEANS IN PRACTICE

AREA	HOW AI SHOWS UP
User stories	AI drafts; I refine for precision and edge cases
API design	AI generates schemas and endpoint contracts; I validate against engineering needs
Research	AI synthesises; I draw prioritisation conclusions
Product building	I design, prompt-engineer, and ship — not just spec and hand off

The result: I move faster on the PM work that used to take the most time, and I bring direct product-building experience into every conversation with engineering.
